Summary

Tech Lead and full-stack engineer driving backend and data infrastructure for a multi-tenant security platform serving **30+ enterprise customers**. Lead a team of **7+ engineers**, rebuilt log ingestion in Rust to sustain **100k logs/sec** with **33% lower compute cost**, and migrated storage to ClickHouse, cutting storage cost **68%** while handling **10 TB/day** ingest. Own end-to-end distributed systems architecture, cloud deployment, observability, and 24/7 production support. Seeking to apply deep systems expertise to accelerate secure, high-scale data pipelines.

Experience

Eventus Security – *Software Engineer (Tech Lead), Foundation Core* India | Jun. 2024 – Present

- Tech lead for **7+ engineers** on a Kubernetes-based, multi-tenant SOC platform serving **30+ enterprise customers**; own architecture, releases, and **24/7 on-call** support.
- Independently rebuilt log ingestion from **JVM services in Rust**, replacing network hand-offs with a memory-mapped circular buffer and disk spill under backpressure; sustained **100,000 logs/sec** without GC pauses or data loss at **33%** lower compute cost.
- Led the migration from **OpenSearch to distributed ClickHouse**, designing ReplicatedMergeTree tables with ZSTD codecs, LowCardinality encoding, typed JSON fields, and bloom-filter skip indexes; cut **storage cost by 68%** and CPU by 10% while supporting **10 TB/day** ingest and sub-second search over billions of events.
- Independently built the platform's **IAM service** end to end: AWS IAM-style allow/deny policies evaluated per request, REST and gRPC APIs, and enterprise federation through SAML, OIDC, and LDAP.
- Developed an **AI-enabled SOAR platform** for alert enrichment, playbook response, and case merging; similarity scoring auto-closed duplicate and low-priority cases, increasing cases handled per analyst by **75%**. Added a RAG-based query interface for threat hunters.
- Built **UEBA** detection using Isolation Forest, autoencoder, GNN, and Random Forest models for user and entity activity; increased detection coverage by **25%** and reduced false positives by **82%**.
- Migrated CI/CD from Jenkins to **GitHub Actions**; wrote pipelines deploying SOAR and UEBA on **GCP** and IAM and other services on **Azure**, provisioning instances with Terraform and configuring them with Ansible.
- Built a Prometheus-style observability service for health, ingest throughput, queue depth, backpressure, and per-tenant usage, with a **React dashboard** and threshold alerts used by the on-call team.

FluentGrid Limited – *Intern* India | Jan. 2024 – May 2024

- Analyzed **5M+** gas, electric, and water meter records to inform regional resource allocation; built an ML-powered barcode reader that increased collection accuracy by **70%** over the earlier workflow.

Mindarray Systems Pvt Ltd (Motadata) – *Intern* India | Jul. 2023 – Dec. 2023

- Built a **Java query system** executing complex filters over **1M+ records** in **<2 ms**; developed a Python/C# log parser for real-time ML-based categorization.

Education

B.Tech., Computer Science Engineering – Indian Institute of Technology, Goa 2020–2024

Technical Skills

- **Languages:** Rust, Python, Java, JavaScript, C++, C
- **Databases & Query:** ClickHouse, PostgreSQL, OpenSearch, SQL, Qdrant, MongoDB
- **Full-stack:** React, Node.js, REST APIs, gRPC, FastAPI, .NET
- **Infrastructure:** Kubernetes, GCP, Azure, GitHub Actions, Terraform, Ansible, Prometheus, Docker, OCI, Linux, Git
- **AI & ML:** Anomaly detection, RAG pipelines, PyTorch, TensorFlow

Projects

Distributed SIEM Log Store and Query Engine (Rust) Jul. 2026 – Present

- Building a SIEM log store with tenant-aware sharding, replicated ingestion, compressed columnar storage, indexed search, automatic promotion of frequently queried JSON fields to typed columns, end-to-end policy-based access control, and a React investigation dashboard.

Automated Correction of Programming Errors Using Deep Learning Feb. 2024 – May 2024

- **GRU/LSTM** models for automated program repair, reaching **95% accuracy** on a purpose-built dataset of 50,000+ C code samples with syntactic errors.
